

Visualization Research

1B Recap (+ Addendum)

As stated in Assignment 1B, elected job site details (Akima LLC, Spellbrush, Epic Games) dictate that in order to achieve the standards needed for my job, I will need:

- Game Engine expertise
- A good Coding hand
- Good Cooperation

All 3 of these traits are what is required of me for entry into one of the three sites I chose. However, there are specifics within each company that I previously brushed aside. For example, Spellbrush requires That I work with an Artificial Intelligence Agent as part of our impending group, and that I get familiar with whatever it may be or say. Epic requires that I limit my endeavors exclusively to Fortnite and all its subsidiaries, something I do not tolerate. Akima requires that I am able to work with other people who are into Final Fantasy, Xenoblade, among other traditional RPGs, but I'm not going for traditional. There's also that thing with VR/AR, but I'm not going that deep, not yet. The best for me, and because its Entry-Level, is Akima.

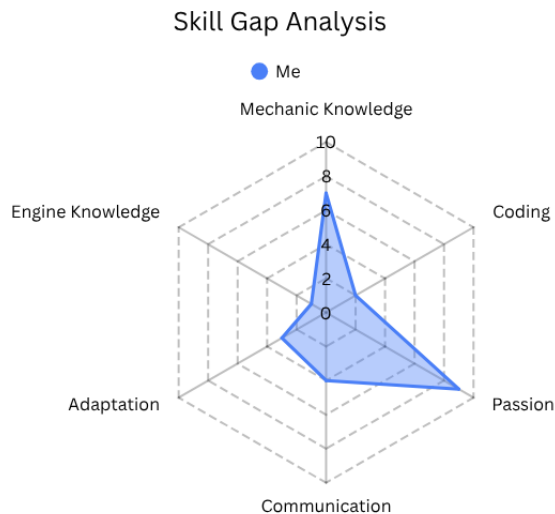

Top Visual Research

Selected Visualization Platforms:

1. [Canva](#)
2. CapCut
3. [draw.io](#)

Canva has a multitude of uses and among them, they are all free. Thought you are able to change backgrounds and access certain materials for a premium subscription, free tier gets the job done regardless. Able to do the jobs of presentations, documents, flowcharts and more. Though it may not be no Adobe Premiere, CapCut has a better video editor. Beyond that however, it's just a video editor. [draw.io](#) is an excellent flowchart designer, able to support a wider multitude of variables, but, much like CapCut is still video-exclusive at the end of the day, [draw.io](#) is still flowchart exclusive. These three were the best out of what I could find, and out of all of them, because the assignment dictated I could only choose one, Canva is my final choice. Not just due to its versatility, but also my innate understanding of its many tools. How else do you think I was able to make most of my concept art for my dream game?

Visual Research

SWOT Analysis		
	Helpful	Harmful
Internal	Strengths - Great Writer - Knows Status and Critical Formulas - Great Designer	Weaknesses - Ameatur Damage Calculator - Ameatur Coder - Dosen't communicate often (unless its in the moment, or has something to share)
External	Opportunities - Learning damage formulas and writing from wikis (Warframe Wiki, Destinytedia, Games Lantern) - Study of existing games and guides from other creators	Threats - Costs of operating at even a small scale are yet to be known. - Support for other team members unknown.

Reflection

Both Site Research and my Visuals worked together to clarify what I needed to do in order to become the man that one of these job listings needs me to be. The initial research acted like a foundation for what was, and the Visuals were built on top. Together, these two research methods were like finally understanding a scripture you were stumped on for weeks. The Visuals acted as a guideline for what my research wanted from me. However, the Visuals also clarified things that initial research could not. The Skill Gap Analysis let me see how proficient I was at what skills I needed. The SWOT Analysis gave me what I had to do to train further for my job, as well as avoid what I didn't need and prep for any pitfalls that may come may way. It was through them that I am now further calibrated for the job that I want.
