Reflection

Each of these listings, all on [Indeed.com](https://www.indeed.com), all contribute towards my desired job in at least some way, shape, or form. Expertise in at least some form of game engine, alongside a good coding hand, are essential parts in game design, the backbone of the job and the reason it, alongside so many professionally made games, even exists. Cooperation with others is a must in making a game faster and better; everything's better when you're doing it with friends. Solo development is impressive, sure, but not as much fun compared to doing it in a group; you even get social perks with it. But more specific ones like player focus, active adaptation to sudden changes in the project, and even passion? That drives the final product forward, not just for you and your team, but for all its eager customers as well. It's these qualities I strive towards in a job like this.

Analysis

Required Skill	Current Proficiency
• Knowledge of Game Mechanics • Proficiency in at least some form of Game Engine • Expert coding skill • Extensive history in cooperation with others • Passion for writing games and rolling with the punches	• Knows what game mechanics are but didn't really consider the extensive math behind them. • Amateur at RPG Maker, beginner in Unity. • Amateur coder. • Group shy, fearing what people might do next.

	• A budding aspiration for worldbuilding, art, and lore, eager to be accepted into the light without prejudice. • Not so great at anticipating surprises.
--	--

These skills are what my reflection in Assignment 1a alluded to. My will to fight my own insecurity and actually work with other people, my extensive interest in gaming, how I wanted Unity as a first step—I had it. And the skills I require, I’m working towards, even if some part of me would rather be off playing games. I’m trying to be the better man, one who cares for his future like his own child. Studying more frequently, taking down notes, practicing my coding skills, and even taking suggestions from other, more successful people online. And the more sudden detours my career may take me on, the more I learn to predict them. I am already outstanding at writing in games in my own way, and I hope to share it with the world. It may not be a lot to many, but it is very *much* a lot to me.

Personal Alignment and Resources

The path to my dream career is not without personal complications. I’m currently laser-focusing on a degree, with help from professors and fellow students. Completely unsure about my financial stability, though I am trying to spend less and get a good credit score. The last time I was on a major group project was donkeys ago, and I don't know if what I want to create will interfere severely with what my **curriculum** wants from me. All I can do now is finish my homework and assignments on time, study hard, and hopefully find my own entry-level job before the end of this semester, if it can even fit into my already-cramped schedule.
